No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DB

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where FI = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,

The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TWP-alpha inhibitor; interleukin 1 antagonist; IL-1 antagonist; TMP; TPO mimetic peptide; EPO mimetic peptide; EMP; VEGF antagonist; MMP inhibitor; antiinflammatory; antitumour; immunosuppressive; cytostatic; antiinfeammatory; antituto; antidabetic; ophthalmological; antianaemic; anorectic; antiinfertility; haemostatic; dermatological; antianaemic; inflammatory disease; autoimmune disease; tumour growth; cancer; rheumatoid arthritis; diabetic retinopathy; infertility; obesity; sleep disorder; neurological degenerative disease; anaemia; thrombocytopaenia; metastatic tumour; systemic lupus erythematosus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Src homology3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-APR-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC prophylactic agent as well as for screening purposes. (I) is useful for CC diagnosing diseases characterised by dysfunction of their associated CC protein of interest, for identifying normal or abnormal proteins of CC interest, as a part of diagnostic kit to detect the presence of their CC interest, as a part of diagnostic kit to detect the presence of their CC proteins of interest in a biological sample. Additionally, (I) is useful CC for treating inflammatory and autoimmune diseases, tumour growth, cancer, CC infertility, and neurological degenerative diseases. (I), comprising EPO-CC mimetic compounds are useful for treating disorders characterised by low CC compounds are useful for treating disorders characterised by low CC compounds are useful for treating disorders characterised by low CC megakaryocyte/platelet deficiency or an expected megakaryocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

This invention relates to novel mammalian CDR mimetibodies, specific portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which

The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is an SH3 antagonist peptide sequence used to make a mimetibody of the invention.
This invention relates to CH1 deleted mimetibodies (and the DNA sequence which encode them), compositions, methods and uses. The invention may be useful for the development of compounds with an immunosuppressive, cardiovascular, cardiant, hypotensive, neuroprotective, nootropic, antibacterial, virucide or fungicide activity. In addition, the discloss sequences may prove useful for gene therapy. The CH1-deleted mimetibody is useful for diagnosing or treating a disease condition in a cell,
                                                                                                                                                                                                                                                                                                                          New CH1-deleted mimetibody polypeptides and nucleic acids, useful for modulating, treating, alleviating, preventing an immune, cardiovascular, or neurodegenerative disease or disorder, anemia, cancer, or infectious
                                                                                                                                                                                                                                                Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-JUN-2002; 2002US-0392431P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-JUN-2003; 2003WO-US020347

The methods and compositions of the present invention are useful for the diagnosis, prevention and/or creatment of diseases or conditions associated with aberrant expression cor activity of the CH1 deleted mimetibody, such as a bone or joint, cc cardiovascular, dental or oral, dermatological, ear, nose or throat, cc endocrine, metabolic, gastrointestinal, gynaecological, hepatic, cc batetric, haematologic, immunological, allergic, infectious, cc musculoskeletal, oncological, neurological, nutritional, ophthalmologic, pediatric, psychiatric, renal or pulmonary disorders. The present cc sequence is that of a peptide which may be used during the creation of a content of the immunological content of the conte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                 AAW11098-W11124 are peptides that bind to the Src SH3 domain. The SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for remulations of proteins involved in signal transduction and also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mimetibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen

                                                                              AAW16924-W16948 are random recombinant peptides derived from one of three peptide libraries, T9, T12 and R8C. The peptides are all SH3 domain-binding peptides. SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Src; SH3; Src homology region 3; binding affinity; oncogenic protein tyrosine kinase; signal transduction; RNA processing; trafficking; translation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 13

                                                                                                                                                                       peptides are selected from: (a) peptides which bind the SH3 domain of Cortactin; (b) peptides which bind the middle SH3 domain of Nck; (c) peptides which bind the SH3 domain of Nck; (c) peptides which bind the SH3 domain of Nck; (d) peptides which bind the SH3 domain of Nck; (e) peptides which bind the SH3 domain of PLC gamma; (f) peptides which bind the SH3 domain of Crk; (h) peptides which bind the SH3 domain of Grk; (r) peptides which bind the SH3 domain of Grk2. The purified binding peptides can be used in the method to identify inhibitors of their binding to their respective SH3 domains, which could be used to modulate the pharmacological activity of proteins or polypeptide containing the SH3 domain. The peptides can also be used to activate Src or Src-related protein tyrosine kinases, to stimulate the immune response by increasing the production of certain lymphokines, e.g. tumour necrosis factor-alpha and interleukin-1, or to deliver a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sparks AB,

cc pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

Cc P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory comercial sasociated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The compression and activity of P. acnes proteins of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes paypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining. ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

CC encoding a Propionibacterium acnes protein. The invention also relates to CC polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to CC immunogenic fragments of P. acnes polypeptides. The invention also relates to CC additionally encompasses expression vectors and host cells comprising a CC polynucleotide of the invention; antibodies against polypeptides of the invention; fusion proteins comprising a polypeptide of the invention; antibodies against polypeptides of the comprising an immune response specific for a P. acnes cc method for stimulating an immune response specific for a P. acnes polypeptide, antibodies, fusion proteins; T cell populations, or CC polynucleotides, antibodies, fusion proteins; T cell populations, or CC patient. The P. acnes polypeptides, polynucleotides, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptide; a method and kit for detecting or determining the presence or absence of P. acnes in a CC patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for inhibiting the development of P. acnes in a CC patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for dargnosing, preventing or treating acne composition. The polynucleotides can also be used as probes or primers for CC conditions of an immune response specific for a P. acnes for cc patient of the vaccine composition is useful for the cc and the kit is useful for performing a diagnostic assay. The present cc invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                 polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central pervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to compregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was completed by the protein in electronic format directly from WIPO at

                                                                                                              cc encoding a Propionibacterium acnes protein. The invention also relates to Cc polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to Cc immunogenic fragments of P. acnes polypeptides. The invention of composent fragments of p. acnes polypeptides. The invention of the invention; antibodies against polypeptides of the invention; antibodies against polypeptides of the invention; a method for stimulating an immune response specific for a P. acnes cc method for stimulating an immune response specific for a P. acnes polypeptides, antibodies, fusion proteins, T cell populations, or cc antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a cc patient; and a method for inhibiting the development of P. acnes in a cc patient. The P. acnes polypeptides, polynucleotides, antibodies, tusion proteins, T cell populations or antigen-presenting cells that express the polypeptides, antibodies in a cc patient. The P. acnes polypeptides, polynucleotides, antibodies the complexity or for stimulating an immune response specific for a P. acnes complexity. The polynucleotides can also be used as probes or primers for complexity or far stimulating an immune response specific for a P. acnes composition is useful for the complexity of the primers for conclete acid hybridisation. The vaccine composition is useful for the complexity of the primers for conclete acid hybridisation. The vaccine composition is useful for the complexity of the primers for conclete acid hybridisation and the P. acnes polypeptide by an order the complexity of the present conclete acid hybridisation, but was obtained in electronic format directly contained within the P. acnes polypucleotides of the complexity of the primers for the primers for the primers for the primers of the complexity of the primers for the primers of the complexity of the primers for the primers of the complexity of the primers for the primers for the primers for the primers for the primer

                                                                                                                                                                             The invention relates to isolated polynucleotide (I) and polypeptide (II) consequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used to in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cuseful for generating antibodies against it, detecting or quantitating a colypeptide in tissue, as molecular weight markers and as a food conjugation of the binding partners are useful in medical imaging consists expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The colypeptide and polynucleotide sequences have applications in conjugation, forensics, gene mapping, identification of mutations crasponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cannot acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences in the printed specification, but was obtained in celectronic format directly from WIPO at fig., wipo.int/pub/published_pct_sequences

Leary JJ;
                                                                                                                                                                                                                                                                                                                                       This sequence represents a Herpes simplex virus type-2 (HSV-2) protein sequence of the invention. This sequence was isolated from a HSV-2 straises (deposited as ATCC VR-2546) DNA fragment designated Contig ID 102. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological response in a mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HSV-2 strain SB5; immunological response induction; therapy; antiviral identification; viral protein inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Herpes simplex virus type-2 sequences - useful in, e.g. prevention and treatment of infection or inducing immunological response in mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            N-PSDB; AAV62132.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 1998-286847/25.

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peq

active composition of matter comprising an Fc domain and pharmacologically e peptides, useful for treating cancer and autoimmune diseases.

Claim 39; Page 298; 608pp; English.

The present invention describes composition of matter (I) comprising a Fc domain, pharmacologically active peptides, and linkers. Where (I) is (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1. P3, and P4 = are each independently sequences of pharmacologically act peptides; L1, L2, L3, and L4 = are each independently linkers; and a, an is:

The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Pc domain (rather than a Pab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc neuroprotective activities. (I) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (I) is useful for cdiagnosing diseases characterised by dysfunction of their associated cc protein of interest, for identifying normal or abnormal proteins of clinterest, as a part of diagnostic kit to detect the presence of their corrections of interest in a biological sample. Additionally, (I) is useful cc for treating inflammatory and autoimmune diseases, tumour growth, cancer, rheumatoid arthritis, diabetic retinopathy, obsetty, sleep disorders, cc infertility, and neurological degenerative diseases. (I), comprising EPO-cc minetic compounds are useful for treating disorders characterised by low red blood cell levels such as anaemia, The TPO-mimetic comprising CC compounds are useful for treating conditions that involve an existing comegakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet cf combocytopaenia, aplastic anaemia, metastatic ct unour which result in thrombocytopaenia, aplastic anaemia, metastatic ct and Fanconi's syndrome. ABB72403 to ABB73426 and ABB135695 to ABB135777 cc exemplification of the present invention

This invention relates to novel mammalian CDR mimetibodies, specific portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which

This invention relates to CH1 deleted mimetibodies (and the DNA see which encode them), compositions, methods and uses. The invention ruseful for the development of compounds with an immunosuppressive, cardiovascular, cardiant, hypotensive, protective, nootropic, antibacterial, virucide or fungicide activity. In addition, the dissequences may prove useful for gene therapy. The CH1-deleted mimetise useful for diagnosing or treating a disease condition in a cell.
                                                                                                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/ or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is an SH3 antagonist peptide sequence used to make a mimetibody of the invention.
                                                                                                                                                                                                                 New CH1-deleted mimetibody polypeptides and nucleic acids, useful for modulating, treating, alleviating, preventing an immune, cardiovascular, or neurodegenerative disease or disorder, anemia, cancer, or infectious

The methods and compositions of the CP resent invention are useful for the diagnosis, prevention and/or CC present invention are useful for the diagnosis, prevention and/or CC cradiovascular, dental or orditions associated with aberrant expression CC cardiovascular, dental or oral, dermatological, ear, nose or throat, CC endocrine, metabolic, gastrointestinal, gynascological, hepatic, CC obstetric, haematological, intermatological, allergic, infectious, consecutoskeletal, oncological, neurological, nutritional, ophthalmologic, musculoskeletal, oncological, neurological, nutritional, ophthalmologic, gediatric, psychiatric, renal or pulmonary disorders. The present CC sequence is that of a peptide which may be used during the creation of a CC mimetibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Src
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW11115 standard; peptide; 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 7
                              AAW11098-W11124 are peptides that bind to the Src SH3 domain. The SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tryrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also specific classes, of proteins involved in signal transduction and also specific classes.
                                                                                                                                                                                                                                                                                                                                                                    Peptide with binding affinity for Src homology region 3 (SH3) domains proteins - useful for e.g. modulating signal transduction pathways at cellular level, esp. protein tyrosine kinase-mediated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-JUL-1994;

                                                                                                                                                                              AAW16924-W16948 are random recombinant peptides derived from one of three peptide libraries, T9, T12 and R8C. The peptides are all SH3 domain-binding peptides. SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific dasses, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related

                                                                                                                                                                                                                                                                                                                                                                                cc conjugated moterns in vention. SH3 (Src homology region 3) binding cc peptides are selected from: (a) peptides which bind the SH3 domain of cortactin; (b) peptides which bind the middle SH3 domain of Nck; (c) peptides which bind the SH3 domain of Nck; (d) peptides which bind the SH3 domain of Nck; (e) peptides which bind the SH3 domain of Nck; (e) peptides which bind the SH3 domain of PLC gamma; (f) peptides which bind the SH3 domain of plc gamma; (c) peptides which bind the SH3 domain of Nck; (h) peptides which bind the SH3 comain of Ycs; and (i) peptides can be used in the method to dentify inhibitors of their binding to their respective SH3 domains, comparting the SH3 domain. The peptides can also be used to activate Src or Src-related protein tyrosine kinases, to stimulate the immune response by increasing the production of certain lymphokines, e.g. conjugated molecule to certain cellular compartments containing Src or Src related proteins
                                                                                                                 밁
                                                                                                                                                               S
                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC The invention relates to an isolated antibody or its portion that CC specifically binds to a protein that shares sequence homology with human CC squamous cell E48 antigen, and consists of amino acid residues 21-116 or CC 1-116 the protein sencoded by 123 novel genes), or a protein consisting of CC amino acid sequence of secreted or full-length polypeptide encoded by CC HLHFPO3 cDNA contained in ATCC Deposit No. 209126. The antibody is CC produced by immunising an animal with amino acid residues 21-116 of CC produced by immunising an animal with amino acid residues 21-116 of CC produced by immunising an animal with amino acid residues 21-116 of CC produced by immunising an animal with amino acid sequence of the Secreted polypeptide encoded by the HLHFPO3 cDNA contained in ATCC Deposit No. 209126, respectively. Also included are an isolated cell that produces the antibody and a hybridoma that produces the antibody. The antibody is a monoclonal, polyclonal, chimeric, humanised or human CC antibody. Optionally, the antibody is a Fab fragment, and is labelled by C alabel chosen from enzyme label, a radioisotope, and a fluorescent CC is an antibody is useful as a probe for differential identification of tissues or cell types in which ADA07417 is expressed. The antibody is such as lupus, transplant rejection, allergic reactions, and arthritis. CC The present sequence is a peptide/protein derived from one of the 123 convel secreted proteins.

```

The invention describes novel human secreted proteins and the nucleot encoding them. The polynucleotides are useful in chromosome identification, for radiation hybrid mapping, in controlling gene expression, in gene therapy or as molecular weight markers. The polynucleotides and polypeptides are useful for diagnosing, treating preventing diseases of the immune system, immunodeficiencies, e.g. Chediak-Higashi syndrome, autoimmune diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, multiple sclerosis, haemolytic anaemia or myasthenia gravis, allergic reactions, e.g. asthma,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inflammatory conditions, e.g. inflammatory bowel disease. They can also be used as a stimulator of B cell responsiveness to pathogens or as an activator of T cells. The polynucleotides and polypeptides are also useful for treating or preventing blood-related disorders, e.g. eosinophilia, thrombosis, thromboembolism, atherosclerosis, myocardial infarction, unstable angina or anaemia. They can also be used for treating, preventing or diagnosing hyperproliferative disorders (cancers), renal disorders (chronic kidney failure, renal tubular acidosis or kidney stones), cardiovascular disorders or respiratory disorders. This is the amino acid sequence of a novel human secreted protein fragment. Note: This sequence is available in electronic format from the US patent office at
